

# SOLVING YOUR FLAT ROOF PROBLEMS FOR THE NEXT 50 YEARS!

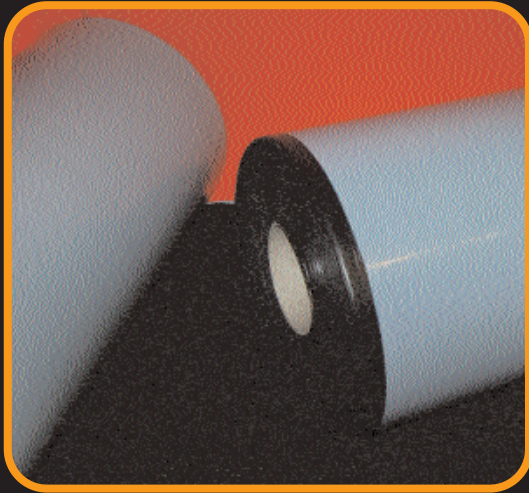

## Self Adhesive EPDM Rubber Roofing *THE* waterproof solution

For the complete waterproof solution to your flat roofing problems then look no further than EPDM rubber roofing, proven to last in excess of 50 years!

By combining the best of all flat roofing mediums to develop the self adhesive EPDM roll, the manufacturers have designed a durable, long lasting product that sports an antislip textured surface and is rot proof, frost proof and fully elastic!

Manufactured by "Continental" in Europe since the '70's, over 40million square metres has already been laid worldwide in such places as the Middle East and The Arctic Circle! Supplied in rolls the self adhesive EPDM is impervious to water, and resistant to heat, cold and ageing. Furthermore, with a thickness of 2.5mm it will not crack like felt, is maintenance free and cleans up easily with soapy water!

The 2.5mm thick EPDM features a textured surface, making it also suitable for walkways, balconies and roof gardens. Beneath the surface lies a layer of reinforcing, not commonly found in most EPDM roof coverings available today, which allows the roof covering to move and flex with the building whilst still retaining its shape and elasticity.

No need to worry about awkward pipes and upstands in the roof as all objects can be overcome with the self adhesive EPDM rubber.

Supplied in rolls for ease of handling and installing, the overlaps are joined safely and quickly using only a hot air gun - no naked flames are required!

Change the outlook of an extension, a garage, a shed or an outbuilding making it both waterproof and more aesthetically appealing with self-adhesive EPDM rubber roofing.
